

AI WORKFLOW INFRASTRUCTURE

Turn document-heavy operations into structured decisions.

Fracto handles document intake, extraction, validation, approvals, and system updates for regulated operations teams.

- Document AI built into end-to-end workflow automation
- APIs, dashboards, reviewer queues, and audit trails
- Designed for BFSI, logistics, mobility, and compliance-heavy operations
- Deployment support for India and Gulf operating requirements

Active clients across India and the Gulf

2M+

Pages processed across live document workflows

1 layer

Intake, parsing, validation, review, and write-back

SOC 2

Security posture for enterprise evaluation

Positioning

Fracto is the execution layer between incoming documents and the business systems that need clean decisions.

THE OPERATIONAL PROBLEM

Critical workflows still move through inboxes, spreadsheets, and approval threads.

OCR alone creates extracted text. Operations teams need validated data, exception handling, approvals, and controlled updates into their systems.

INTAKE

Documents arrive from everywhere

Email, portals, WhatsApp, APIs, and batch uploads create scattered intake.

REVIEW

Teams re-key and chase approvals

Manual checks slow SLAs and create avoidable rework.

RISK

Audit evidence is fragmented

Approvals and exceptions live in folders, chats, and email trails.

SCALE

Cost grows with every new file

Volume spikes require more reviewers instead of better automation.

Typical failure pattern

- Documents land in many channels
- Fields are typed into spreadsheets or core systems
- Exceptions are handled in email or chat
- Audit trail is rebuilt later during reviews

What buyers need instead

- One accountable workflow run per case
- Structured extraction with confidence and validations
- Reviewer queues only for low-confidence exceptions
- APIs and webhooks into existing business systems

WHAT FRACTO PROVIDES

A workflow platform with document AI built in.

01

Intake orchestration

Accept files through email, portal, webhook, API, or batch upload.

02

Classification and parsing

Identify document type, extract fields, and normalize outputs.

03

Policy validation

Run rule checks, completeness checks, and cross-field validations.

04

Exception workflow

Send uncertain cases to reviewer queues with context and evidence.

05

Approvals and audit

Track decisions, timestamps, comments, and handoffs in one trail.

06

System write-back

Return structured data and decisions into LOS, ERP, TMS, or internal systems.

OPERATING MODEL

Fracto sits inside existing business workflows without forcing a system rip-and-replace.

01**Receive**

Documents enter through a product app, customer portal, mailbox, API, or batch source.

02**Process**

Fracto extracts, validates, and flags exceptions with structured outputs.

03**Review**

Only unresolved cases move to reviewers with evidence and comments.

04**Return**

Decisions, fields, and audit status flow back to the system of record.

Integration options

- REST APIs for synchronous workflows
- Webhook callbacks for async document jobs
- Dashboard and reviewer queues for operations teams
- Custom field mapping into customer or internal systems

Deployment expectations

- Workflow discovery and sample document review
- Parser and rule configuration for the first use case
- Security, access, and audit requirements aligned upfront
- Production rollout after measurable workflow proof

WHERE FRACTO IS RELEVANT

Used across document-heavy operating teams in lending, logistics, mobility, and compliance.

The common pattern is high-volume document intake where speed, accuracy, and traceability matter.

Good-fit workflows

- Customer, vendor, or driver intake with KYC documents
- Loan file intake and underwriting preparation
- Logistics invoice, POD, and billing document checks
- Vendor, fleet, or driver compliance refresh workflows

Business value

- Reduce manual review across high-volume document workflows
- Improve turnaround time without adding reviewer headcount
- Create a repeatable workflow layer across teams and business units
- Expand from first document flow into broader operations automation

HOW FRACTO CREATES VALUE

Start with one concrete workflow, then expand into adjacent document operations.

The best deployments begin with a narrow use case, clear documents, and a measurable handoff into the customer system.

Automate

Replace manual document handling with structured extraction, rules, and review states.

Integrate

Connect workflow outputs into existing products, dashboards, and systems of record.

Expand

Grow from the first document flow into more workflows, higher volume, and deeper automation.

Best-fit buyers and teams

- Operations teams in lending, logistics, mobility, and compliance
- Product teams building document-heavy customer or vendor journeys
- Shared service teams handling repetitive document review
- Enterprise teams seeking a repeatable automation layer across business units

What makes the first workflow work

- Known document types and business rules
- Sample files with expected output formats
- Defined review and exception owner
- Clear success metric: time saved, accuracy, SLA, or exception rate

RECOMMENDED FIRST STEP

Run a focused workflow pilot before broader rollout.

Suggested 2-week pilot scope

- Pick one use case and 2 to 4 document types
- Share sample documents, field schema, and validation rules
- Configure extraction, review states, and output payloads
- Connect through API, webhook, dashboard, or batch flow
- Review accuracy, exception rate, turnaround time, and rollout path

Outcome

A working workflow, measurable pilot results, and a clear expansion plan for production rollout.

What Fracto brings

- Workflow discovery and solution design
- Document AI, validation rules, and reviewer queue setup
- API and webhook support for integration
- Operational reporting and audit trail for go-live

What we align on together

Use case
